

Complete Technical Plan

Personal Productivity OS · Full Feature Upgrade

1. Complete Feature Audit

13 existing navigation items across 4 groups:
core: Dashboard · GATE Roadmap · Subjects · Habits · Tasks · Goals
performance: Deep Work · Fitness · Sleep
reflect: Journal · Analytics · AI Coach
system: Settings

Existing Views and Their Current Functional State

VIEW	WHAT WORKS	WHAT'S BROKEN / MISSING	PERSISTENCE
Dashboard	Layout, ring components, charts render	All KPI values hardcoded. '38% syllabus', 'DAY 22' hardcoded. Insights hardcoded.	None
GATE Roadmap	Phase expand/collapse, progress bars, real days-to-GATE calc	Overall % derived from hardcoded GATE_SUBJECTS. Month plan fully static.	None
Subjects	Subject list, selection, ring display, daily chart	No CRUD. Progress/conf/hours/PYQ all hardcoded constants. Chart uses fake data.	None
Habits	Day toggles work (in-memory). Streak/rate displayed.	Streak not recalculated from toggles. Rate not recalculated. No CRUD. 'Add Habit' button has no handler.	None
Tasks	Done toggle works (in-memory). Priority colors work.	No CRUD. No due date. No category filtering beyond tab.	None
Goals	Progress bars render. Milestone dots.	No CRUD. Progress is hardcoded. Milestones unconfigurable. No notes field.	None
Deep Work	Pomodoro timer fully functional. Mode switching. Start/pause/stop.	Sessions not logged. Stats (5h 20m, streak) hardcoded. Study distribution chart fake.	None
Fitness	Exercise completion toggles (in-memory). Week/day navigation. Calendar rendering. Strength rings.	Completed state lost on nav away. Strength history hardcoded. Measurements not tracked.	None
Sleep	Charts render. Log table displays.	All sleep data hardcoded. No log entry CRUD. Stats calculated from hardcoded array.	None
Journal	Entry list/selection works. Mood bar renders.	4 hardcoded entries. 'New Entry' button has no handler. No editing. Full text not editable.	None
Analytics	Charts render.	All chart data is WEEKLY/HEATMAP constants. Heatmap randomly generated on load.	None
AI Coach	Display renders cleanly.	All 5 insights hardcoded strings. All metrics hardcoded. Action items hardcoded.	None

VIEW	WHAT WORKS	WHAT'S BROKEN / MISSING	PERSISTENCE
Settings	Toggles work (in-memory). Profile displays.	No real settings saved. Export button no-op. 'Synced' status is fake. Day counter '22' hardcoded.	None

Design System Preserved (Non-Negotiable)

Colors: / #081A22 / #0D2430 · Green #14B112 · Teal #1A8FA3 · Yellow #EAB308 · Red #EF4444 · Purple #A78BFA

Fonts: Syne · DM Mono · Outfit

All CSS class names, card styles, animation system, ring component, sidebar layout — untouched.

2. Architecture Recommendation

Recommended: `localStorage` + `React Context` + `useReducer`

Why NOT Supabase / Firebase / PostgreSQL:

- This is a personal single-user OS with no multi-device sync requirement stated.
- Adding a backend introduces auth complexity, network dependency, latency on every read/write, hosting costs, and points-of-failure.
- The data is personal and sensitive (health, physique, facial measurements).
- None of that complexity is justified here.

Why `localStorage` over `IndexedDB`:

- Total data volume even after 2 years of daily logging stays well under 5 MB (`localStorage` limit is typically 5–10 MB per origin).
- Subjects, habits, tasks, goals, sessions, sleep, journal, appearance logs — all are small JSON objects.
- `IndexedDB` is appropriate for binary files, large datasets, or complex queries.
- `localStorage` is simpler, synchronous, and perfectly reliable for this scale.

State Management:

A single `AppContext` holding the complete `store` object, updated via a `dispatch` function. Each domain (habits, tasks, subjects, etc.) is a key in the store. Auto-save on every state change via `useEffect`.

Tradeoffs Summary:

`localStorage` is **synchronous** (no `async/await` anywhere), zero latency, zero config, works offline permanently.

Downside: single-browser, no cross-device sync.

If cross-device ever becomes a requirement, the entire store can be migrated to Supabase in one operation by swapping the load/save functions — the rest of the app is untouched. **This is the correct tradeoff for a personal productivity OS.**

3. Storage Schema

	DEEPWORKSESSIONS[]	
	id, name, cat	string
	mins, rating	number
	date, start	ISO string
	notes	string
	SLEEPLOGS[]	
	id, date	ISO string
	bed, wake	time HH:MM
	dur, qual	number
	deep, rem	number (hours)
	notes	string
	FITNESSCOMPLETED	
	'w3d0_pat'	→ boolean
	'w3d0_done'	→ day complete
	strengthHistory[]	per-week records
	string	
	→ text, done	
	string	
RS[]	FITNESSMEASUREMENTS[]	
	date	ISO string
q	weight, bodyFat	kg, %
	waist, neck	cm
	forearms, arms	cm
	chest, shoulders	cm
RIES[]	thighs, calves	cm
	SETTINGS + PROFILE	
	name, college	string
	height, startWeight	cm, kg
	gateTarget, gateDate	string
	startDate	ISO → Day N calc
	toggles[]	notifs, ai, etc.

TS[]	HAIRLOGS[]	
	date	ISO string
	fallSeverity	1–5
	scalp_Oil, scalp_Itch	boolean
	dandruff	boolean
	notes	string
	HAIRLINENOTES[]	
	date	ISO string
GS[]	observations	string
	photos: false	text only
Hrs	DERMVISITS[]	
	date, doctor	string
	treatment	string
	nextVisit	ISO date
SS[]	notes	string
	GROOMLOGS[]	
	date	ISO string
os[]	beard, eyebrows	boolean
	haircut, nails	boolean
	oral, fragrance	boolean
	LOOKSMAXXITEMS[]	
	id, name, category	string
	priority	high med low
	progress	0–100
	deadline, notes	string
	done	boolean

4. Hardcoded Data Audit

Every constant that needs to become real user data:

CONSTANT / VALUE	WHERE IT APPEARS	SHOULD BECOME	TYPE
GATE_SUBJECTS[] — all progress/conf/hours/pyq values	Roadmap, Subjects, Dashboard '38%', Analytics	Editable per-subject in store. Progress % editable. Hours logged from sessions.	User data
HABITS[] — days[7], streak, rate all hardcoded	Habits view, Dashboard snapshot	Habits from store. days[] from HabitLog entries. streak/rate calculated dynamically.	Calculated
TASKS[] — 8 fixed tasks	Tasks view, Dashboard snapshot	Tasks array from store. CRUD-managed.	User data
GOALS[] — progress, ms, done all fixed	Goals view	Goals from store. progress edited by user. milestones toggled.	User data
SESSIONS[] — 5 fake sessions	Deep Work history panel	Sessions logged by Pomodoro timer to store. Real timestamps.	User data
WEEKLY[] — study/dsa/score per day	Dashboard chart, Analytics, Habits chart, AI Coach metrics	Computed from deepWorkSessions grouped by date. No manual entry needed.	Calculated
SLEEP_LOGS[] — 7 days hardcoded	Sleep view charts and table	sleepLogs[] from store. User adds entries via form.	User data
JOURNAL[] — 4 hardcoded entries	Journal view	journalEntries[] from store. CRUD-managed.	User data
HEATMAP — Math.random() 52×7	Analytics view	Computed from deepWorkSessions — mark cell if any session exists that day.	Calculated
STRENGTH_HISTORY[] — weekly progress fixed	Fitness Strength Progress tab	Logged from strengthHistory[] in store. User adds weekly records.	User data
Sidebar '38% syllabus covered'	Sidebar countdown block	avg(gateSubjects.map(s => s.progress)) calculated live.	Calculated
Sidebar 'DAY 22'	User profile card at bottom	Math.floor((today – profile.startDate) / 86400000) + 1	Calculated
Dashboard KPIs: '87%', '91%', '74%', '83%', '79%'	5 KPI cards at top of Dashboard	Calculated from habit completion %, subject avg, sleep quality avg, etc.	Calculated
Dashboard rings: '6.2h', '6/7', '8/9'	Today's Progress rings	Today's sessions sum, today's habit completions from today's HabitLog entries.	Calculated
Dashboard stats: '4/12', '247 PYQs', '4 Mocks'	GATE progress banner	subjects with progress>80 / total. pyq avg from subjects. sessions where cat=GATE counted.	Calculated
AI Coach insights: all 5 hardcoded strings	AI Coach view	Generated by recommendation engine from real data gaps.	Replace entirely
Dashboard AI Insights: 3 hardcoded strings	Dashboard bottom-right card	Top 3 items from recommendation engine.	Replace entirely
fitnessCompleted[] — in-memory in FitnessView	Fitness exercise ticks, calendar	Persisted to store.fitnessCompleted keyed 'w3d0_pat'.	User data

5. Gap Analysis

Missing features vs. spec + additional evidence-based recommendations:

ENTIRE MISSING SECTION — APPEARANCE

spec	Appearance Hub — Overview of all appearance domains with scores, streaks, priority actions.	spec	Facial Assessment System — Paste-in facial report with date, scores, strengths, weaknesses, priorities. Comparison across reports. No photo storage.
spec	Facial Development — Mastic gum tracking (mins/day, frequency), neck exercises (sets/reps/weight), mewing consistency, jaw exercises.	spec	Eye Area Optimization — Sleep/hydration/screen time/dark circles/puffiness/fatigue tracking. Evidence-based only. No redness tracking.
spec	Skincare — AM routine (cleanser, niacinamide, Vit C, moisturizer, SPF). PM routine (cleanser, moisturizer, retinol), daily log, consistency streak, lifestyle factors.	spec	Hair & Scalp — Daily hair fall severity log, hairline monthly notes, scalp oiliness/itch/dandruff, hair routine (oil, shampoo, treatments), dermatologist visit log with follow-up reminders.
spec	Grooming — Beard/shave log, haircut log, eyebrow grooming, nail care, oral hygiene, fragrance. Grooming consistency score.	spec	Looksmaxxing Roadmap — Face/Body/Lifestyle categories, each item with priority, progress, deadline, notes, completion.

MISSING FROM EXISTING SECTIONS

spec	Aesthetic Measurements Dashboard — Weight, body fat %, waist, neck, forearms, arms, chest, shoulders, thighs, calves with trend charts.
spec	Vascularity Tracker — Weight + BF% + water intake + forearm size trends combined into one visual tracker.
spec	Confidence Tracker — Social confidence, eye contact, communication confidence, public interaction rating per week.
spec	CRUD for Every Entity — Habits, tasks, goals, subjects, sessions, sleep entries, journal entries. Currently all add/edit buttons are no-ops.
spec	Posture Tracker — Forward head posture score, rounded shoulder correction, neck posture log, corrective exercises tracking.
spec	Forearm Development Module — Wrist curls, reverse wrist curls, hammer curls, farmer carries, dead hangs, grip work with sets/reps/weight/history.
spec	Weekly Wins Log — Accomplishments, social victories, personal improvements.
spec	Dynamic Recommendation Engine — Generate real insights from real data gaps. No hardcoded advice strings.

ENGINEERING ADDITIONS (Evidence-Based, Support Stated Goals)

- **Supplement Tracker** — Finasteride/Minoxidil schedule with adherence log. Hairline treatment is HIGH priority per aesthetic physique goals. Dermatologist recommended this immediately.
- **Neck Circumference Tracker** — Added to Fitness measurements — highly relevant for aesthetic physique goals (V-taper appearance). Neck size is part of stated physique goals.
- **Daily Hydration Log** — Simple L/day entry integrated into facial dev and physique sections. Impacts vascularity, skin, eye area simultaneously. Cross-domain impact on 3 separate stated goals.
- **Recovery Score** — Composite metric from sleep quality + duration + hydration + workout intensity. Surfaces in Dashboard and AI Coach. Visible in existing Sleep and Dashboard sections.
- **Jawline Improvement Timeline** — Body weight + BF% trend correlated with periodic facial assessment scores to measure actual jaw definition progress. Fat loss is #3 priority in facial report. Cross-domain analytical value.
- **Screen Time Daily Log** — Relevant to eye area appearance (puffiness, fatigue) and sleep quality. Simple manual entry. Connects eye area optimization to lifestyle.

- **Stress Level Daily Rating (1–5)** — Influences skin oiliness, sleep quality, hair fall, and facial puffiness. Cross-domain analytical value. Connects multiple appearance domains.
- **Beard Decision Tracker** — Since report flags patchy beard as actively hurting appearance, a dedicated 'beard style commitment' tracker with growth stage log. High priority item per facial analysis report.

6. Navigation Plan

Before adding any navigation items, here is the analysis of what can be consolidated vs. what needs its own section:

New section group: appearance — This is large enough and distinct enough from all existing sections (Fitness handles physical performance, not appearance tracking) to warrant its own sidebar group.

New nav items to add — 4 items, not 6+:

- Appearance (appearance)** — Overview hub: facial scores from latest report, skincare streak, hair health score, grooming consistency score, looksmaxxing roadmap, weekly wins. This absorbs Looksmaxxing and the Confidence tracker as tabs rather than separate nav items.
- Facial Dev (facial)** — Dedicated page for jawline (mastic gum), neck exercises, mewing/posture consistency, eye area optimization, and the facial assessment report database.
- Skincare (skincare)** — AM/PM routine logging, lifestyle factors (hydration, sleep, stress, screen time), consistency tracking.
- Hair & Scalp (hair)** — Hair fall logs, hairline notes, scalp health, dermatologist visits/supplements, grooming log. Grooming is integrated here as a tab rather than a separate nav item because beard, haircut, eyebrow, and nail care are naturally adjacent to hair management.

Measurements and vascularity are integrated into the existing **Fitness** section as new tabs, not separate nav items. This keeps navigation clean.

Confidence tracker and weekly wins are integrated into the **Appearance** hub as a tab, not a separate nav item.

Updated Navigation Structure

CORE (no label)	Dashboard GATE Roadmap Subjects Habits Tasks Goals
PERFORMANCE	Deep Work Fitness Sleep
APPEARANCE ← new group	Appearance Facial Dev Skincare Hair & Scalp
REFLECT	Journal Analytics AI Coach
SYSTEM	Settings

Total: 17 navigation items (was 13). Net addition: 4 items in 1 new group. Clean and justified.

7. Phase-by-Phase Implementation Plan

1

Foundation & Persistence

Zero visible UI change. Everything works. Nothing is lost on refresh.

Phase 1

- Design complete localStorage schema. Single key apexos_v1 → full JSON store.
- Build useLocalStorage(key, default) hook with load-on-mount + save-on-change via useEffect.
- Build AppContext + provider wrapping entire app. Store + dispatch available everywhere.
- Migrate all constants (HABITS, TASKS, GOALS, GATE_SUBJECTS, SESSIONS, SLEEP_LOGS, JOURNAL) to store defaults. On first load, populate from defaults. On subsequent loads, use stored data.

- Persist Fitness exercise completion (completed[]) and calendar done state to store.fitnessCompleted.
- Persist Pomodoro completed sessions to store.deepWorkSessions on timer completion.
- Add profile.startDate to store. Calculate 'DAY N' and syllabus % dynamically from stored data.
- Wire Settings Export button to JSON.stringify(store) + download. Wire Import to JSON.parse + confirm dialog.

2

Customization & CRUD Systems

Every add/edit/delete button becomes functional. Full data ownership.

Phase 2

- Build reusable Modal component matching existing design language. Accepts title, children, onClose. Used for all CRUD operations.
- Habits CRUD: Add (name, emoji, color, category), Edit, Delete. Streak recalculated from HabitLog entries on every render. Completion % = days done / total days logged.
- Tasks CRUD: Add (title, priority, tag, time, due date, notes), Edit, Delete. Task completion toggle persists.
- Goals CRUD: Add (title, desc, deadline, color), Edit. Progress slider. Add/toggle milestones. Delete. Notes field.
- Subjects CRUD: Add subject (name, emoji, phase, importance), Edit progress/conf/hours/pyq/target/notes, Delete.
- Sleep log CRUD: Add entry (date, bed, wake, quality, deep, rem, notes), Edit, Delete.
- Journal CRUD: Full text editor for entries (title, body, mood, tags, wins[], lessons[]), Add, Edit, Delete.
- Session logging: After Pomodoro completes, auto-show 'Log Session' mini-form (subject, name, rating). Also manual session add.
- Fitness measurements: Add measurement entry form to Fitness section (new 'Measurements' tab). Weight, BF%, waist, neck, arms, forearms, chest, shoulders, thighs, calves.

3

Dynamic Statistics & Analytics

Replace every hardcoded constant. All KPIs, charts, and insights come from real data.

Phase 3

- Dashboard KPIs: Study Score = avg(last 7 days session quality). Consistency = habit completion % this week. DSA Mastery = avg(dsa-tagged subjects). Fitness = workout completion % this week. Execution = tasks done / tasks total.
- 'Today's Progress' rings: Study = today's session mins / daily target. DSA = today's daily target. Habits = today's habit log done count. Workout = today's fitness day done boolean.
- Weekly chart: group deepWorkSessions by date, aggregate study hours per day for last 7 days.
- Habit streaks: for each habit, walk backwards from today through its HabitLog entries counting consecutive done=true. Stop on first miss.
- GATE syllabus %: avg(gateSubjects.map(s => s.progress)). 'Subjects Done': subjects with progress > 80. Mock tests: sessions where cat='GATE'. Color intensity = session minutes that day.
- Sleep stats: avg duration, avg quality, bedtime consistency score (std dev of bed times), wake consistency from sleepLogs[].
- Recovery score = weighted composite: sleep quality (40%) + sleep duration adequacy (30%) + hydration (20%) + workout rest adherence (10%).
- Navigation badges update from real data: Habits badge = current max streak. Tasks badge = total pending. Subjects badge = subjects actively in progress.

4

Appearance & Facial Development

Complete new Appearance section. 4 new nav items. Pre-loaded with facial analysis data.

Phase 4

- AppearanceView (hub): Overall appearance score card. Domain scores (skin, hair, grooming, facial dev). Looksmaxxing roadmap with Face/Body/Lifestyle tabs and CRUD items. Confidence tracker with weekly social ratings. Weekly wins log. Priority actions list.

- Facial Assessment system: Pre-load June 2025 report from provided HTML (scores: overall 6.4, jaw 5.5, skin 5.2, hair 5.8, eyes 6.5, nose 6.8, symmetry 7.2; full strengths/weaknesses/priorities). Paste-in form for future reports. Compare button between any two reports to show what improved/worsened. Improvement timeline.
- FacialDevView: Jawline section (mastic gum mins/day log, weekly consistency streak, masseter progress notes). Neck section (curl/extensions/lateral/isometric sets/weight log, neck strength score progression). Mewing/Posture consistency (daily checkbox + score). Eye Area section (sleep score, hydration, screen time, dark circle notes, puffiness notes). No eye redness tracking.
- SkincareView: Configurable AM steps (cleanser, niacinamide, Vit C, moisturizer, SPF — pre-loaded from report recommendation). PM steps (cleanser, moisturizer, retinol). Daily log: steps done. Consistency streak. Lifestyle factors (water, sleep, stress, screen time pulled from other store keys). Skincare score.
- Hair & Scalp + Grooming view: Hair fall daily log (1–5 scale with notes). Hairline monitoring tab (monthly observation notes, no photos). Scalp health log (oil, itch, dandruff). Hair routine tracker (oil schedule, shampoo schedule). Medical tab (dermatologist visits CRUD, treatment/medication log, supplement adherence — Finasteride/Minoxidil with daily tick). Grooming tab (beard decision tracker with growth stage, haircut log, eyebrow grooming, nails, oral, fragrance). Grooming consistency score.
- Pre-populate looksmaxx items from facial report priorities: Skincare routine (high), Dermatologist visit (high), Sleep 7.5h+ (high), Body fat reduction (high), Beard decision (high), Eyebrow grooming (med), Mewing + posture (med), Mastic gum (med), Lip care (low).

Aesthetic Physique Systems

5

Fitness section expanded with measurements, forearm dev, vascularity, posture. Aligned with V-taper / aesthetic goals.

Phase 5

- Fitness: New Measurements tab: Body measurement log (weight, BF%, waist, neck, forearms, arms, chest, shoulders, thighs, calves). Trend history table. Trend sparklines for each metric.
- Fitness: Vascularity tracker: Composite view showing weight + BF% + water intake + forearm size trend + 'vascularity conditions' score based on BF% and hydration. Renders combined chart.
- Fitness: Forearm Development tab: Log wrist curls, reverse wrist curls, hammer curls, farmer carries, dead hangs, grip work. Sets/ reps/weight per exercise. Progress history. Forearm size correlation from measurements.
- Fitness: Posture tab: Daily forward head posture score (1–5). Rounded shoulder score. Neck posture log. Corrective exercise checklist (neck stretches, wall angels, chin tucks, etc.). Progress trend.
- Aesthetic priority callouts in Fitness overview: highlight lateral delts, rear delts, upper chest, lats, forearms, neck as V-taper priority muscles. Visual aesthetic priority guide card.
- Connect body fat % from measurements to Facial Dev 'Jawline Improvement Timeline' — when BF% drops, correlate with facial assessment score changes.

Recommendation Engine

6

No hardcoded advice. Every insight generated from the user's actual data gaps and trends.

Phase 6

- Build generateRecommendations(store) function. Returns array of {icon, title, text, color, category, urgency}. Called on every view render, memoized with useMemo.
- Academic rules: If subject.progress < 50 and phase is active → flag. If no study session in last 3 days → study gap warning. If avg session rating < 3 days → study gap warning. If avg session quality < 3 → quality warning.
- Appearance rules: If skincare log < 5/7 days → streak low flag. If dermatologist log overdue (> 90 days since last) → alert. If DSA fall log shows severity ≥ 4 for 3+ consecutive days → escalation. If sleep avg < 7h → eye area / skin impact warning. If grooming log missing > 3 days → consistency warning.
- Fitness rules: If BF% not logged in 30 days → log prompt. If posture score avg < 3 → posture prompt. If forearm measurements flat > 4 weeks → plateau flag. If workout completion < 60% this week → consistency warning.
- Lifestyle rules: If sleep avg duration < 7h this week → sleep debt warning. If hydration avg < 2.5L → dehydration flag (affects vascularity + skin + eye area). If stress avg > 3.5 → stress impact warning. If recovery score < 60% →

recovery priority.

- Dashboard shows top 3 recommendations. AI Coach shows all recommendations sorted by urgency, grouped by category. Each recommendation has one clear action item.
- Dynamic priority ranking for Appearance hub: sort looksmaxxing items by (urgency from recommendation engine × evidence-based facial assessment weight × current streak gap). Not static.

7

Final Integration & Optimization

Everything talks to everything. Polish, performance, edge cases.

Phase 7

- Cross-domain connections: sleep quality → appearance hub. BF% → jaw definition index → facial dev. Hydration → vascularity score + skin + eye area.
- Sidebar stats update live: syllabus % real, Day N real, nav badges real (max streak, pending tasks count).
- Analytics view: replace all fake data with real computed charts. Add appearance analytics panel (skincare streak trend, hair fall trend, grooming consistency over time).
- Performance: memoize expensive calculations (recommendation engine, streak calculations, weekly aggregations) with useMemo. Only recalculate when relevant store keys change.
- Edge cases: empty state screens for new users (no data yet). Loading states. Confirmation dialogs for destructive actions (delete habit, delete goal, delete facial report).
- Settings: Export full JSON backup. Import from JSON backup with validation. Reset to defaults option. Profile editing (name, start date, height, weight target, GATE exam date).

X

Phase X — Jawline Progress System

Evidence-based facial fat tracking correlated with assessment scores over time. Between Phase 4 and Phase 5.

Optional Phase

- Jawline Improvement Timeline: plot body weight + BF% over time on one chart. Overlay facial assessment 'jaw score' from periodic reports as milestones on the timeline.
- Neck measurement trend correlated with neck exercise log from Facial Dev module.
- Quarterly facial assessment prompt: after 90 days since last report, show reminder card in Appearance hub suggesting it's time for a new assessment.
- Improvement delta view: side-by-side comparison of any two facial reports. Green = improved scores. Red = declined. New items added. Items resolved.

Y

Phase Y — Recovery & Sleep System

Sleep and recovery become a first-class performance domain. Between Phase 3 and Phase 6.

Optional Phase

- Sleep consistency score: calculate standard deviation of bedtime and wake time across last 14 entries. Lower std dev = higher consistency score.
- Sleep → appearance correlation: display 'Your skin/eye area appearance improves X% on days with 7.5h+ sleep' based on user's own logged data once 14+ entries exist.
- Recovery score composite displayed as a sixth KPI ring. Surfaces in Fitness overview as recovery readiness indicator.
- Sleep goal setting: user sets target bed/wake times in Settings. Sleep view shows red/green against target for each logged entry.

8. Pre-Implementation Verification Checklist

Before writing a single line of code, confirm:

■	No existing feature removed All 13 nav items preserved, all views preserved, all components preserved, all workout data (W3–W6 days) preserved, Pomodoro timer preserved.
■	Design language locked #050B12 background, #14B112 green, all font families, all CSS classes, card styling, animation system — all untouched.
■	Architecture choice justified localStorage chosen for correct reasons. Not overengineered. Migrateable to cloud if ever needed.
■	Eye redness excluded No eye redness tracker, metric, analytics, recommendation, or screen space allocated. Clarified and respected.
■	No photo storage Facial Assessment is text-only (paste-in reports). No image upload, no photo gallery, no file storage.
■	Physique goals incorporated Measurements dashboard, vascularity tracker, forearm dev module, posture tracker all included. Aesthetic priority callouts in Fitness section emphasize lateral delts, rear delts, upper chest, lats, forearms, neck.
■	Facial report pre-loaded June 2025 report data (overall 6.4, jaw 5.5, skin 5.2, hair 5.8, eyes 6.5, nose 6.8, symmetry 7.2, full priorities list) seeded as default first facial report in store.
■	Evidence-based only No pseudoscientific eye exercises. No face yoga. Eye area section focuses on sleep, hydration, screen time, dark circles, puffiness, grooming. Mewing included with accurate 'slow effect' framing per facial report's own language.

Ready to proceed to implementation. The plan is complete. Say the word and Phase 1 begins — the full code will be delivered as a single upgraded [App.tsx](#) that is a drop-in replacement for the existing file.
